MARCH 16, 1917

No. 11

RACK AND DISINFECTOR FOR CLINICAL THERMOMETERS.

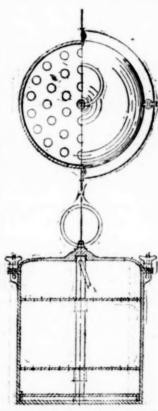

A CONVENIENT PORTABLE APPARATUS.

By B. E. Holsenpore, Pharmacist, United States Public Health Service,

The necessity for a convenient portable container and disinfector to handle the large number of clinical thermometers very frequently

required for use in taking the temperatures of passengers and crews undergoing quarantine inspection, as well as of persons detained for observation at a quarantine station or detention camp, has often On many occasions, in been apparent. quarantine work, the temperatures of scores of passengers are taken simultaneously, or as nearly so as the number of thermometers carried by the boarding or inspecting officer will permit. Since it is the usual practice to carry such thermometers in their individual cases, to prevent breakage, and to disinfect or cleanse each one before passing it to the passenger or member of the crew, repeating the operation after recording the temperature reading and before returning the thermometers to their cases, it can readily be seen that there is considerable labor involved and some loss of time incident to this process.

With a view of overcoming these difficulties, at least in a measure, the writer designed and had made a model of a container and rack having a capacity of 40 thermometers, which has been used successfully at the San Juan quarantine station for some months past.

Upper.—Plan of container-rack and cover.

Lower.—Section through container.

As will be seen from the drawings, the thermometers are held securely but separately in place by means of two perforated disks, through which they pass, while a third disk serves as a bottom plate to prevent them from slipping through. This latter disk has a few

29

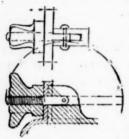

perforations, so as to offer but little resistance and permit the rack to enter easily when the container is filled with the liquid. perforations, however, are not coincident with those of the upper disks.

The center post, or main stem, not only serves as a frame to hold the disks of the rack together, but, with its ring inserted in the upper end, permits of its use as a handle. The thermometer does not come in contact with the hands of any one except the person whose tem-

perature is being taken.

The container is simply a cylindrical jar, equipped with a pair of hinged thumbscrews for use in fastening on the lid or top, so that it will be absolutely water-tight. The lid should be provided with a rubber gasket. The lid has also a slot in the center, into which the main stem of the rack slips, thus preventing any movement of the

rack in the container when the lid has been screwed on.

Section and elevation of a detail of sealing device.

The rack and container may be made of aluminum of medium weight or a good quality of enameled ware. The hinged thumbscrews and sockets, however, should be made of brass. The container of the one in use at present at San Juan quarantine station is a glass specimen jar, which serves the purpose very well for station use, but on account of its fragile character and liability to breakage, it is not well adapted for The metallic container is practically indispens-

use aboard vessels. able for use on boarding duty.

The method of using this apparatus, in order to obtain the best results, is as follows:

The rack is loaded with its quota of thermometers (for this model 40), each of which has been shaken so that the column of mercury registers not higher than normal. The container is then partially filled with a formalin solution (or whatever other disinfectant it is customary to use) to about four-fifths of its capacity. This has been shown by experience to be the quantity of solution necessary to completely submerge the thermometers, without slopping over, when the loaded rack is lowered into the container.

When the rack is inserted, the disinfecting solution will reach every part of each thermometer. The perforations in the disks, while holding the thermometers in place, permit free and thorough contact with the solution and an efficient disinfection. By giving the rack a twirling movement, the cleansing process may be made even more effective. It is also the usual practice to screw on the top of the container and keep the thermometers in the solution until a short time before they are required for use. The rack is then taken out and rinsed with sterile water to remove the unpleasant taste or odor of the disinfectant, and the thermometers are allowed to dry in the rack without being touched with the hands.

If the thermometers are required for use aboard ship, the rack should be placed in a dry container, and the lid or top screwed on. The thermometers are then ready to be handed out to each pas-

senger without further preparation.

A pair or several pairs of racks and containers should be provided for boarding officers at stations where temperatures of a considerable number of passengers or crews have to be taken. One container will hold the dry sterile thermometers and the other one a loaded rack in the disinfecting solution. These containers could be carried in a leather or canvas case and slung across the shoulder, as is done with field glasses.

The advantage of using the apparatus in pairs, one with the solution and the other dry, is that if but 40 or a lesser number of thermometers be required those in the dry container are available for immediate use, and if more than that number those in the rack in the solution jar may be removed, rinsed, and dried during the time that the first 40 are being passed around. The first 40 may in turn be loaded in their rack and placed in the disinfectant should a still larger number of thermometers be required.

All thermometers registering more than normal should be shaken down before being placed in the rack, thus doing away with the necessity of having to touch any of them to do this after they have

been disinfected.

It is believed that this apparatus will not only save considerable time in routine practice at quarantine stations and in large hospitals, but that it will enable one to disinfect thermometers more thoroughly and with less danger of breakage than is possible under ordinary methods. In addition it will prevent them from becoming contaminated after disinfection through careless handling or by inclosing them in soiled thermometer cases.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

UNITED STATES.

CEREBROSPINAL MENINGITIS.

Minnesota.

Collaborating Epidemiologist Bracken reported that during the period from December 26, 1916, to March 10, 1917, 33 cases of cerebrospinal meningitis, with 16 deaths, were notified in Minnesota, as follows: Chippewa County, Granite Falls Township, schoolgirl, sick December 26, 1916, died January 8, 1917. Faribault County, Blue Earth, schoolgirl, sick January 14, died January 21. Freeborn County, Albert Lea, butcher, sick January 18, died January 27. Hennepin County, Minneapolis, boy 2 years old, sick January 13. died January 23; boy 9 years old, sick February 8, died February 10; barber, sick February 12, recovered; prostitute, sick February 16, died February 22; locomotive fireman, sick February 17; schoolgirl, sick February 19; railroad laborer, sick February 20, recovered; girl 3 years old, sick February 21, died March 7; boy 3 years old, sick February 22, died February 26; schoolgirl, sick February 26, died March 7; girl 7 months old, sick February 28, died March 1; college man, sick February 3, improved; housewife, sick March 5. died March 10. Mower County, Moscow Township, farmer, sick March 2, improved. Ramsey County, St. Paul, railroad laborer, sick January 13, died January 16; negro 3 years old, sick February 10; girl 3 months old, sick February 19; foundryman, sick February 21; messenger, sick February 25; laborer, sick February 28; boy 5 years old, sick March 3: boy 6 years old, sick March 5, improved. Rice County, Faribault, girl 3 years old, sick February 8, died February 11. Rock County, Martin Township, girl 6 months old, sick February 3, died February 8. St. Louis County, Duluth, housewife, siek December 28, died January 7; schoolboy, sick January 25; schoolgirl, sick February 2; schoolgirl, sick February 14, recovered; dairyman, sick February 15. died February 16. Mountain Iron village, schoolboy, sick February 15, recovered.

CEREBROSPINAL MENINGITIS—Continued.

Hawaii Report for January, 1917.

During January, 1917, two new cases of cerebrospinal meningitis were reported in Honolulu, Hawaii.

LEPROSY.

City Report for Week Ended Feb. 24, 1917.

During the week ended February 24, 1917, one case of leprosy was reported in San Francisco, Cal.

MALARIA.

City Reports for Week Ended Feb. 24, 1917.

During the week ended February 24, 1917, one case of malaria was reported in Newark, N. J., one case and one death were reported in New Orleans, La., and four cases were reported in Sacramento, Cal.

MEASLES.

California-Los Angeles.

Senior Surg. Brooks reported that during the week ended March 3, 1917, 210 cases of measles were notified in Los Angeles, Cal. One hundred and forty-two cases were reported during the previous week, and 627 cases were reported during the month of February.

Kentucky-Louisville.

Passed Asst. Surg. Herring reported that during the period from February 15 to 28, 1917, 130 cases of measles were notified in Louisville, Ky.

Washington-Seattle.

Surg. Lloyd reported that during the week ended February 24, 1917, 74 cases of measles were notified in Scattle, Wash., making a total of 6,796 cases reported since the beginning of the epidemic, February 15, 1916.

RABIES IN ANIMALS.

City Reports for Week Ended Feb. 24, 1917.

During the week ended February 24, 1917, five cases of rabies in animals were reported in Buffalo, N. Y.; one case was reported in Detroit, Mich.; and three cases were reported in Niagara Falls, N. Y.

SCARLET FEVER.

See Diphtheria, measles, scarlet fever, and tuberculosis, page 412.

SMALLPOX.

Connecticut.

Collaborating Epidemiologist Black reported that during the week ended March 3, 1917, 21 cases of smallpox were reported in Connecticut, as follows: Berlin 4, Easton 7, Stonington 1, Waterbury 9.

Massachusetts Worcester.

Collaborating Epidemiologist Kelley reported that 2 cases of smallpox were notified at Worcester, Mass., March 8 and 1 case March 14, 1917.

Minnesota.

Collaborating Epidemiologist Bracken reported that during the week ended March 10, 1917, 5 new foci of smallpox infection were reported in Minnesota, cases of the disease having been notified as follows: Kittson County, Hallock 1; Marshall County, Bigwoods Township 1; Ottertail County, Deercreek Township 5; Wilkin County, Rothsay 1; Wright County, French Lake Township 10.

Texas Galveston.

Surg. Bahrenburg reported that 1 new case of smallpox was notified at Galveston, Tex., March 9, 1917.

TYPHUS FEVER.

Texas.

Senior Surg. Pierce reported that during the week ended February 17, 1917, two cases of typhus fever were reported in Texas—one at Eagle Pass and one at Laredo. During the same week 40,395 persons were inspected. Of these, 3,961 were disinfected for destruction of vermin. Five sick persons were detained for observation, and 34 were refused admission on account of illness.

City Report for Week Ended Feb. 24, 1917.

During the week ended February 24, 1917, one case of typhus fever was reported in El Paso, Tex.

FOREIGN.

CHINA.

Examination of Rats-Shanghai.

During the two weeks ended January 20, 1917, 514 rats were examined at Shanghai. No plague infection was found. The last plague-infected rat at Shanghai was reported found during the week ended May 6, 1916.

Plague-Infected Rats-Hongkong.

During the two weeks ended January 27, 1917, out of 3,746 rats examined at Hongkong, 6 were found plague infected.

CHOSEN (KOREA).

Cholera-Summary, August-December, 1916.

The total number of cases of cholera notified in Chosen (Korea) during the period from the outbreak of the disease in August, 1916, to December 29, 1916, was 1,998. Of these, 1,624 cases occurred in natives.

GREAT BRITAIN.

Examination of Rats, August-December, 1916-Bristol.

During the period from August 1 to December 31, 1916, 1,675 rats were examined at Bristol. No plague infection was found.

UNION OF SOUTH AFRICA.

Plague-Transvaal.

An outbreak of plague occurred in December, 1916, in the Transvaal, Union of South Africa, the focus of infection being a farm in the Potchefstroom district, about 90 miles distant from Johannesburg. From December 21, 1916, the date of the first known plague death, to January 7, 1917, eight fatal cases were notified. During the week ended January 14, 1917, two cases occurred on the infected farm, and during the same period a focus of infection was discovered on an adjoining farm, with two cases. The total number of cases reported to January 14, 1917, was 12, with 11 deaths.
